EFB recognized the need for a Releasable Tactical Plate Carrier that could accommodate cable management inside the carrier shell to reduce snag points, free up valuable MOLLE space and also allow easy access to a variety of applications such as Power Systems, Push to Talk Radio headset cabling and concealable antenna. During the design phase we also recognized the need to reduce the weight of this Plate Carrier while maintaining the ballistic integrity of the Armor. We chose state of the art materials for their lightweight properties and comfort. We carefully selected lightweight proven armor panels and plates and integrated them to produce the Lightweight Improved Releasable Plate Carrier with Integrated cable management. The integrated cable management allows the user to conceal 95% of any wiring that may have been woven through the MOLLE on other vests to be run inside the plate carrier shell all but eliminating cable snag points. Please take a moment to review the features of the SWIP²ES LIRPC. The shell is available in a variety of camouflage patterns as well as solid colors.
